

Investigative Outbreak Report. Dynamical Fever

Problem: A disease called Dynamical Fever (DF) causes near-annual outbreaks in dogs and people in Antananarivo. DF became a reportable disease in Tana in 2013, a veterinary vaccine became available in 2015 and a human vaccine in 2018. Investigate the available case data from 2013-2020 in order to advise the Ministry of Health on the most effective human/dog vaccination policy to adopt in 2021 to promote elimination of DF in all populations.
